

RC4

Ron Rivest
1987

RC4: $\text{BYTE}^k \rightarrow \text{BYTE}^\infty$
for any $k \in [1..256]$

```
Algorithm RC4(byte string K)
byte i,j      //all arith involving these mod 256
for i ← 0 to 255 do S[i] ← i
j ← 0
for i ← 0 to 255 do
    j ← j + S[i] + K[i mod |K|]
    S[i] ↔ S[j]

i, j ← 0
repeat
    i ← i + 1
    j ← j + S[i]
    S[i] ↔ S[j]
output S[(S[i] + S[j]) mod 256]
```

Algorithm ChaCha20(**key**, **ctr**, **non**)

ChaCha20: $\text{BYTE}^{32} \times \text{BYTE}^{16} \rightarrow \text{BYTE}^{64}$

Algorithm QR(a,b,c,d)

a += b; d ^= a; d <<= 16;
 c += d; b ^= c; b <<= 12;
 a += b; d ^= a; d <<= 8;
 c += d; b ^= c; b <<= 7;

ChaCha20

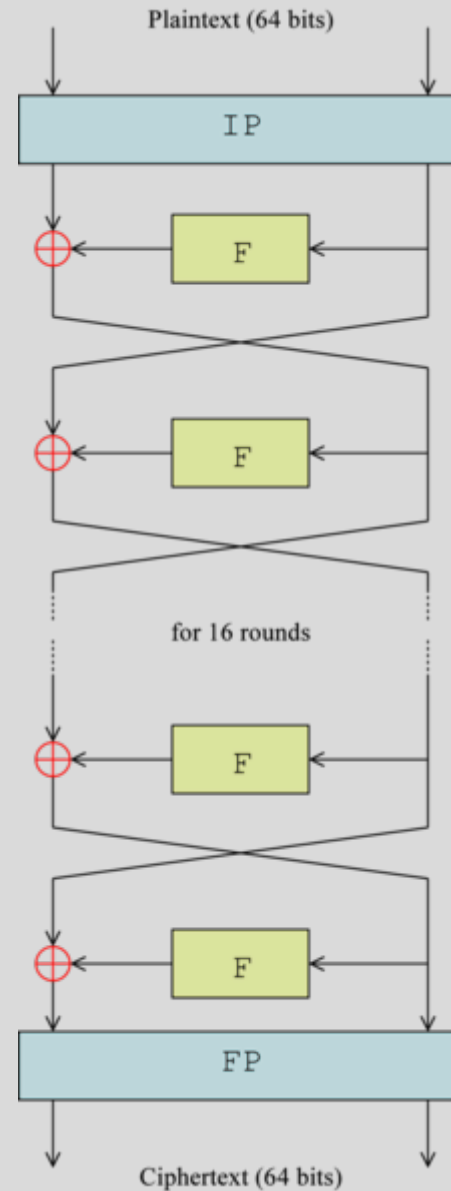

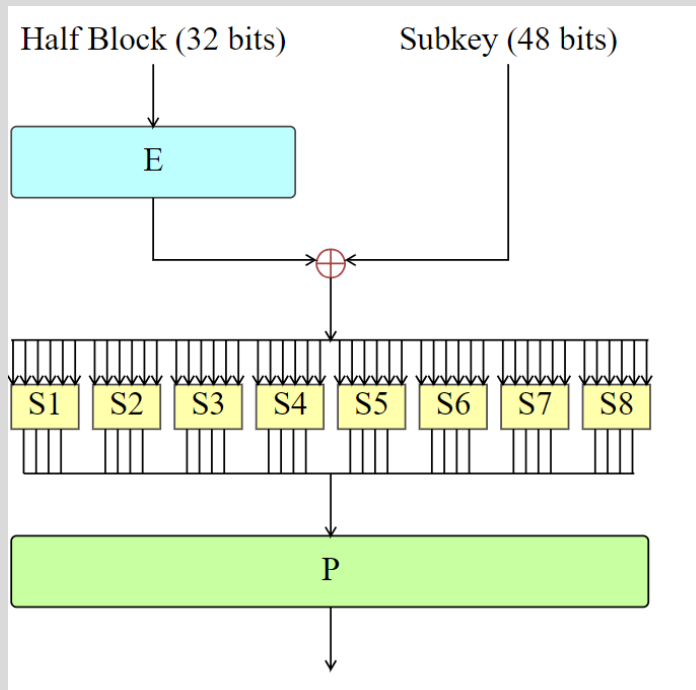

Nice design

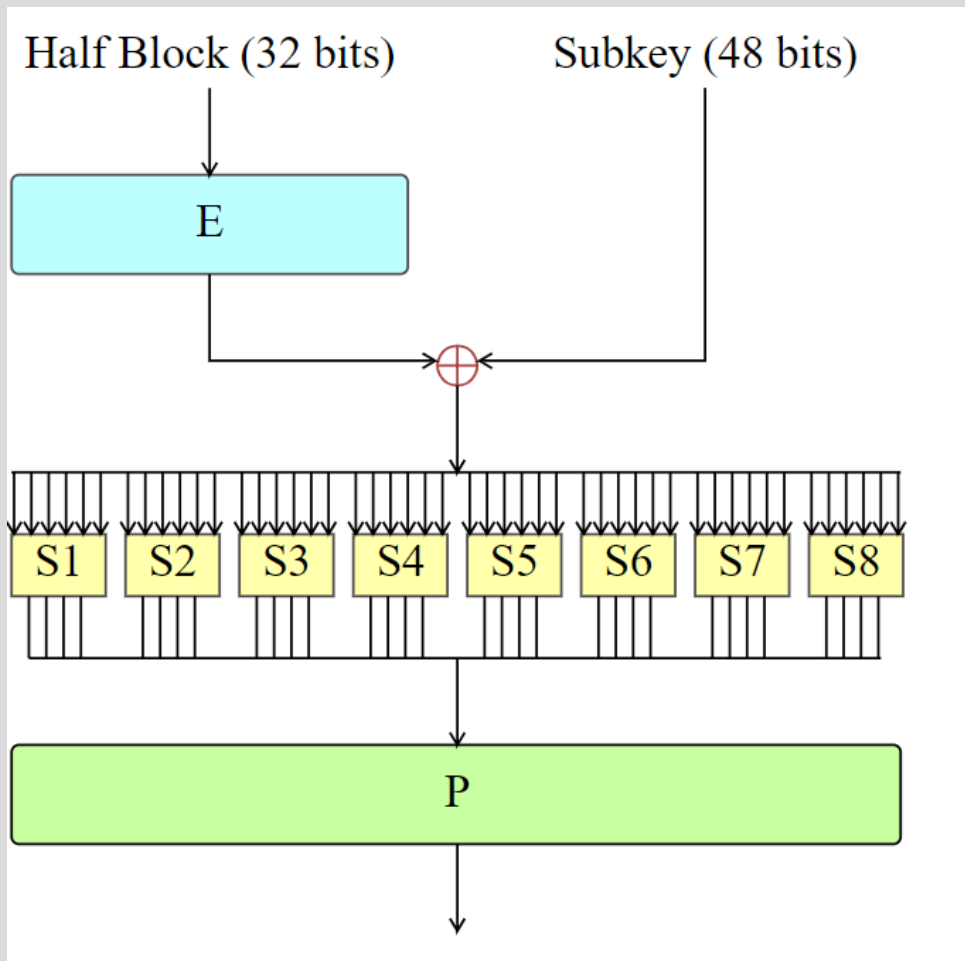

1. Good choice of signature – PRF with 32, 16, 64 byte key, input, output
2. Security has held up very well – no remotely damaging attacks
3. Very fast in SW, with no special HW instructions (eg., 2.3 cpb Sandy Bridge)
4. Sparse use of operations – “ARX” (add-rotate-xor are only ops used)
5. Constant time – no tables
6. Open design, no intelligence-agency involvement

DES

IBM/NSA
1975

DES: $\{0,1\}^{56} \times \{0,1\}^{64} \rightarrow \{0,1\}^{64}$

Definition of DES S-Boxes

TABLE 2.6 Definition of DES S-Boxes

| Row | Column Number | | | | | | | | | | | | | | | | Box |
|-----|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------------|
| | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | |
| 0 | 14 | 4 | 13 | 1 | 2 | 15 | 11 | 8 | 3 | 10 | 6 | 12 | 5 | 9 | 0 | 7 | S ₁ |

DES

- Historically important but outmoded design
- Politics by way of mathematics

1. Has held up well for its key length
2. But key length is was chosen to permit governmental breaks
3. Other political choices, too: hardware requirement, IP/FP, standardization obstructions
4. Secret, non-competitive process. Design criteria secret (although eventually disclosed by Don Coppersmith, after everything had been figured out)
5. Led to the advances in cryptanalysis, particularly differential and linear cryptanalysis
6. Led to advances in theory, starting with Luby-Rackoff result

AES

Rijndael

Joan Daemen and Vincent Rijmen
1998/2002

$$\text{DES: } \{0,1\}^{56} \times \{0,1\}^{64} \rightarrow \{0,1\}^{64}$$

Figure 5.3 AES Encryption and Decryption

AES

Another nice design

1. Good signature
2. Security has held up very well – no remotely damaging attacks
3. Hardware support has emerged on Intel and other platforms, making the algorithm extremely fast (like 0.625 cpb when usage mode permits parallelism)
4. Not great without hardware support
5. Open design, minimal intelligence-agency involvement

What exciting event will happen Friday, Feb 8, in this very class?!

Question #1

Why is it preferred for a PRF/PRP to run in constant time?

Question #2

Consider the PRG $G: \{0,1\}^{100} \rightarrow \{0,1\}^{200}$ defined by

$$G(x) = x \parallel x$$

An adversary A can do well in breaking G by taking in a 200-bit string $y = y_1 y_2$ (where $|y_1| = |y_2|$) and answering 1 if

Question #1

and answering 0 otherwise.

This adversary gets advantage

Question #2
