

Logistics

Instructor:

- Prof. Bertram Ludaescher
(ludaesch@ucdavis.edu)
 - Office Hours: M, 12-1:30pm, 3051 Kemper Hall

Teaching Assistants:

- Megan Raul (meghanraul@me.com)
 - Office Hours: TBD 53/55 Kemper Hall
- Harini Sabbela (hhsabbella@ucdavis.edu)
 - Office Hours: TBD 53/55 Kemper Hall
- Steven Crites (sbccrites@ucdavis.edu)
 - Office Hours: TBD 53/55 Kemper Hall

Overview of topics:

Database design, Entity-Relationship model, Relational Model and Algebra, query language SQL, indexing, query processing, transaction management, hands-on exercises/application programming.

Instructor:

* Prof. Bertram Ludaescher (ludaesch@ucdavis.edu)
Office Hours: M 12-1:30pm, [3051 Kemper Hall](#)

Teaching Assistants:

* Megan Raul (meghanraul@me.com)
Office Hours: TBD [53/55 Kemper Hall](#)
* Harini Sabbela (hhsabbella@ucdavis.edu)
Office Hours: TBD [53/55 Kemper Hall](#)
* Steven Crites (sbcrites@ucdavis.edu)
Office Hours: TBD

165A Course Topics

- Database Design, ER Model
- Relational Model, Relational Algebra
- SQL (Structured Query Language)
- Integrity Constraints
- Storage structures, Indexing
- Query Processing
- Transactions
- Additional Topics & Current Trends

165A Course Topics

- Focus is on
 - **Foundations** (relational model, queries, SQL,...)
 - **Practical experience** with SQL
 - We'll use PostgreSQL
 - A "real" (full-featured), scalable DBMS
 - Open source, available @CSIF and @home!
 - » also looking at MySQL, SQLite, and
 - » Embedded SQL (e.g. with Python)
- **Individual** Assignments
- Group Project at the end

Basic Database Architecture

Query Processing

Grading and Policies

- Grading:
 - Approximately (see web page for details):
 - 40% Homework Assignments
 - 20% Midterm (also individual ;-)
 - 40% Final (and yes: this one too!)
- Academic Conduct
 - Be polite
 - Don't cheat
- Ask when in doubt
- Make good use of the mailing-list!

Why study databases / data management?

- Critical to business, government, science, culture, society, ...
- Determines success of many corporations (even their existence)
- Many tech companies built on data management (Google, Amazon, Yahoo!, Facebook, ...)
- ... or offer database products (Microsoft, IBM, Oracle)
- Database systems span major areas of computer science
 - Operating systems (file, memory, process management)
 - Theory (languages, algorithms, complexity)
 - Artificial Intelligence (knowledge-based systems, logic, search)
 - Software Engineering (application development)
 - Data structures (trees, hash-tables)
 - **... and the DB research community continues to be very active**

Lots of Data Everywhere

- From <http://en.wikipedia.org/wiki/Petabyte> :
- **History:** According to Kevin Kelly in [The New York Times](#), "the entire [written] works of humankind, from the beginning of recorded history, in all languages" would amount to 50 petabytes of data.^[1]
- **Computer hardware:** [Teradata](#) Database 12 has a capacity of 50 petabytes of compressed data.^{[2][3]}
- **Telecoms:** AT&T has about 16 petabytes of data transferred through their networks each day.^[4]
- **Archives:** The [Internet Archive](#) contains about 3 petabytes of data, and is growing at the rate of about 100 terabytes per month as of March, 2009.^{[5][6]}
- **Internet:** [Google](#) processes about 20 petabytes of data per day.^[7]
- **Physics:** The 4 experiments in the [Large Hadron Collider](#) will produce about 15 petabytes of data per year, which will be distributed over the [LHC Computing Grid](#).^[8]
- **P2P networks:** As of October 2009, [Isohunt](#) has about 9.76 petabytes of files contained in [torrents](#) indexed globally.^[9]
- **Games:** [World of Warcraft](#) utilizes 1.3 petabytes of storage to maintain its game.^[10]

Science has been changing lately ...

- “All science is either physics or stamp collecting.”
 - Ernest Rutherford, British chemist & physicist (1871 - 1937)
[J. B. Birks "Rutherford at Manchester" (1962)]
- That is, from few data, lots of thinking
- ... to LOTS OF DATA and ANALYSIS
➔ “Data-driven” scientific discovery!
4th paradigm, in addition to hypothesis-driven science

The 4th Paradigm

Science Paradigms

- Thousand years ago:
science was **empirical**
describing natural phenomena
- Last few hundred years:
theoretical branch
using models, generalizations
- Last few decades:
a **computational** branch
simulating complex phenomena
- Today: **data exploration** (eScience)
unify theory, experiment, and simulation
 - Data captured by instruments or generated by simulator
 - Processed by software
 - Information/knowledge stored in computer
 - Scientist analyzes database/files using data management and statistics

$$\left(\frac{\dot{a}}{a}\right)^2 = \frac{4\pi G\rho}{3} - K\frac{c^2}{a^2}$$

Jim Gray on eScience: A Transformed Scientific Method

Based on the transcript of a talk given by Jim Gray
to the NRC-CSTB¹ in Mountain View, CA, on January 11, 2007²

Some Characteristics of Data in Databases

Data is persistent

- One or more applications use the same data
- Data stored between applications

Data often too large to easily manage in-memory

- DBMSs handle this for free
- Manually handling data (files) is usually *ad hoc* (each app. does it differently) and can be inefficient

Data may be very large (business, government, science, ...)

- Library of congress > 20 terabytes of print
- Amazon.com: > 42 terabytes of data
- Youtube: > 45 terabytes of video
- AT&T: > 323 terabytes of call records
- National Energy Research Scientific Computing Center: > 2.8 petabytes

* 1 terabyte $\approx$ 1,000,000,000,000 bytes

* 1 petabyte $\approx$ 1,000,000,000,000,000 bytes (and there is talk about exabytes at DOE)

Also: Data(bases) can be Yummy!

Exploits of a Mom <http://xkcd.com/327/>
