

Midterm Exam

Instructions: The exam has **six** pages, including this cover page, printed out two-sided (no more wasted paper). Please read the questions carefully, then answer carefully. Be mathematically precise, and precise and grammatical with your English, too; you *know* what an ogre that crazy professor is.

Good luck,
phil rogaway

Name:

Notation:

CFG = context free grammar

CFL = context free language

CNF = Chomsky normal form

DFA = deterministic finite automaton

NFA = nondeterministic finite automaton

PDA = pushdown automaton

reasonably efficient = polynomial running time

On page	you got

1 True or False

Indicate if the following statements are **true** or **false**, by **filling in** (darkening) the correct box. Some of the questions will be familiar, but do be careful. Do **not** provide any justification. If in doubt, guess; missing answers will be treated as.

-
- | | | |
|--|-------------------------------|--------------------------------|
| 1. There is an efficient algorithm to decide if a multivariate polynomial over the integers has an integer root. | <input type="checkbox"/> True | <input type="checkbox"/> False |
|--|-------------------------------|--------------------------------|
-
- | | | |
|-----------------------------------|-------------------------------|--------------------------------|
| 2. $L = \emptyset$ is a language. | <input type="checkbox"/> True | <input type="checkbox"/> False |
|-----------------------------------|-------------------------------|--------------------------------|
-
- | | | |
|--------------------------------------|-------------------------------|--------------------------------|
| 3. All finite languages are regular. | <input type="checkbox"/> True | <input type="checkbox"/> False |
|--------------------------------------|-------------------------------|--------------------------------|
-
- | | | |
|--|-------------------------------|--------------------------------|
| 4. An infinite language can have an infinite complement. | <input type="checkbox"/> True | <input type="checkbox"/> False |
|--|-------------------------------|--------------------------------|
-
- | | | |
|--|-------------------------------|--------------------------------|
| 5. All infinite languages have infinite complements. | <input type="checkbox"/> True | <input type="checkbox"/> False |
|--|-------------------------------|--------------------------------|
-
- | | | |
|---|-------------------------------|--------------------------------|
| 6. The union of infinitely many regular languages is regular. | <input type="checkbox"/> True | <input type="checkbox"/> False |
|---|-------------------------------|--------------------------------|
-
- | | | |
|--|-------------------------------|--------------------------------|
| 7. If L is regular then so is $\{xx : x \in L\}$. | <input type="checkbox"/> True | <input type="checkbox"/> False |
|--|-------------------------------|--------------------------------|
-
- | | | |
|---|-------------------------------|--------------------------------|
| 8. If L is regular then so is $\{xy : x, y \in L\}$. | <input type="checkbox"/> True | <input type="checkbox"/> False |
|---|-------------------------------|--------------------------------|
-
- | | | |
|--|-------------------------------|--------------------------------|
| 9. Let $A = \{1^{2^p} : p \text{ is prime}\}$. Then A^* is regular. | <input type="checkbox"/> True | <input type="checkbox"/> False |
|--|-------------------------------|--------------------------------|
-
- | | | |
|--|-------------------------------|--------------------------------|
| 10. The pumping lemma is a useful tool to show that a language is regular. | <input type="checkbox"/> True | <input type="checkbox"/> False |
|--|-------------------------------|--------------------------------|
-
- | | | |
|--|-------------------------------|--------------------------------|
| 11. Language $L = \{w \in \{0, 1\}^* : w \text{ has an equal number of 01's and 10's}\}$ is regular. | <input type="checkbox"/> True | <input type="checkbox"/> False |
|--|-------------------------------|--------------------------------|
-
- | | | |
|---|-------------------------------|--------------------------------|
| 12. For every number n , the language $L_n = \{0^n 1^n\}$ is regular. | <input type="checkbox"/> True | <input type="checkbox"/> False |
|---|-------------------------------|--------------------------------|
-
- | | | |
|---|-------------------------------|--------------------------------|
| 13. If there's a 10-state DFA that accepts L then there's a 20-state DFA that accepts L . | <input type="checkbox"/> True | <input type="checkbox"/> False |
|---|-------------------------------|--------------------------------|
-
- | | | |
|--|-------------------------------|--------------------------------|
| 14. Given a DFA M , there is a reasonably efficient procedure to find a <i>smallest</i> DFA for $L(M)$. | <input type="checkbox"/> True | <input type="checkbox"/> False |
|--|-------------------------------|--------------------------------|
-
- | | | |
|--|-------------------------------|--------------------------------|
| 15. Given an NFA M , we know a reasonably efficient procedure to find a <i>smallest</i> NFA for $L(M)$. | <input type="checkbox"/> True | <input type="checkbox"/> False |
|--|-------------------------------|--------------------------------|
-

16. If M is an NFA then $(L(M))^*$ can be accepted by an NFA.	<input type="checkbox"/> True	<input type="checkbox"/> False
---	-------------------------------	--------------------------------

17. If L^* is regular then L is regular.	<input type="checkbox"/> True	<input type="checkbox"/> False
--	-------------------------------	--------------------------------

18. If M is an NFA and there is one abb -labeled path from the start state to a final state, and there is another abb -labeled path from the start state to a non-final state, then M is <i>invalid</i> : it neither accepts nor rejects abb .	<input type="checkbox"/> True	<input type="checkbox"/> False
---	-------------------------------	--------------------------------

19. If there's a 10-state NFA that accepts L then there's a 100-state DFA that accepts L .	<input type="checkbox"/> True	<input type="checkbox"/> False
--	-------------------------------	--------------------------------

20. Given $h: \Sigma \rightarrow \{0, 1\}^*$, define $h(L) = \{h(a_1) \cdots h(a_n) : a_1 \cdots a_n \in L\}$. Then $h(L)$ is regular if L is regular.	<input type="checkbox"/> True	<input type="checkbox"/> False
--	-------------------------------	--------------------------------

21. If L^* is context free then L is context free.	<input type="checkbox"/> True	<input type="checkbox"/> False
--	-------------------------------	--------------------------------

22. All DFA-acceptable languages are context free.	<input type="checkbox"/> True	<input type="checkbox"/> False
--	-------------------------------	--------------------------------

23. You can always convert a PDA into an NFA for the same language.	<input type="checkbox"/> True	<input type="checkbox"/> False
---	-------------------------------	--------------------------------

24. Every subset of a context free language is regular.	<input type="checkbox"/> True	<input type="checkbox"/> False
---	-------------------------------	--------------------------------

25. There's a reasonably efficient procedure to decide if a string w is in the language of a CNF CFG G .	<input type="checkbox"/> True	<input type="checkbox"/> False
--	-------------------------------	--------------------------------

26. If a CFG G is in CNF, then G is <i>not</i> ambiguous.	<input type="checkbox"/> True	<input type="checkbox"/> False
---	-------------------------------	--------------------------------

27. Some PDAs need infinite-length descriptions, as the rules (productions) can be an arbitrary subset of $V \times (V \cup \Sigma)^*$.	<input type="checkbox"/> True	<input type="checkbox"/> False
--	-------------------------------	--------------------------------

28. The context-free languages are closed under union.	<input type="checkbox"/> True	<input type="checkbox"/> False
--	-------------------------------	--------------------------------

29. The context-free languages are closed under complement.	<input type="checkbox"/> True	<input type="checkbox"/> False
---	-------------------------------	--------------------------------

30. If A and B are regular then $\{xy \mid x \in A \text{ and } y \in B \text{ and } x = y \}$ is context free.	<input type="checkbox"/> True	<input type="checkbox"/> False
--	-------------------------------	--------------------------------

2 Short Answer

- Complete the following sentence, being mathematically precise and following the conventions of your text: A **DFA** is a five-tuple $M = (Q, \Sigma, \delta, q_0, F)$ where Q is a finite set, Σ is an alphabet, $q_0 \in Q$, $F \subseteq Q$, and δ is a function with domain and range .
- Carefully explain what it **means** if I say: “the context-free languages are closed under intersection.” Don’t indicate if the statement is true or false—just provide a precise mathematical translation of the meaning of the claim.

- List the first five strings, in lexicographic order, of the language

$$L = \{x \neq y : x, y \in \{0, 1\}^* \text{ are unequal strings}\}$$

Here “ \neq ” is a formal symbol, just like 0 and 1. Assume that characters are ordered $0 < 1 < \neq$.

- Sketch, briefly and informally, how a PDA for

$$L = \{x \neq y : x, y \in \{0, 1\}^* \text{ are unequal strings}\}$$

would work.

- Give an example of a claim that we proved using the **product construction**. Don’t prove the claim—just make a precise claim that was proven with the product construction.

6. Let $M = (Q, \Sigma, \delta, q_0, F)$ be a DFA. In class and in the online notes we described an algorithm to minimize the number of states in a DFA for $L(M)$. The algorithm worked by defining an equivalence relation \sim on pairs of states of Q . In particular, we said that

$$p \sim q \text{ if for all } x \in \Sigma^*, \boxed{}.$$

You will wish to use the notation $\delta^*(q, x)$, as we did in class, to indicate the state you are in if you start in state q and consume the string x .

7. You are given the regular expression $\alpha = (000)^* \cup (111)^*$. Composing the constructions given in class and in your text (do not “simplify” anything), imagine converting α into a **DFA** M for which $L(M) = L(\alpha)$. How many states will M have?

8. Specify a CFG for the language $L = \{a^n b^m : m > n\}$. Make your CFG as simple as possible.

9. Complete the definition, being precise with any quantifiers and not using any form of the word “ambiguous” in your definition:

A CFL L is *inherently ambiguous* if:

10. Carefully state the *pumping lemma* for **context free** languages. Don’t use the word “pumps” and be careful with any quantifiers.

11. How many states are in a *smallest* DFA for the language $L_n = (a^n)^*$ if the underlying alphabet is $\Sigma = \{a, b\}$? (Note: $b^n \notin L_n$.)

12. Continuing the last problem: how would you prove that, for all n , there is no *smaller* DFA for L_n ? (You don't need to provide such a proof, but name the main "tool" and sketch the main idea.)

13. A *regular grammar* is a context-free grammar $G = (V, \Sigma, R, S)$ in which every rule is of the form $A \rightarrow \varepsilon$ or $A \rightarrow aB$, where a is a terminal and A and B are variables. Suppose that L is regular, say $L = L(M)$ for a DFA $M = (Q, \Sigma, \delta, q_0, F)$. Define a CFG $G = (V, \Sigma, R, S)$ such that $L = L(G)$ by saying:

14. A *prefix* of a string y is a string x such that $y = xx'$ for some x' . A prefix is *proper* if it is not the empty string. For any language L , let $\mathcal{G}(L) = \{w \in L \mid \text{no proper prefix of } w \text{ is in } L\}$. List the elements of $\mathcal{G}(\{\varepsilon, 00, 01, 110, 0100, 0110, 1110, 1111\})$.

15. In a paragraph of 2–5 clear and grammatical English sentences, answer the following question: what is the *scientific value* of having multiple characterizations of a class of languages, such as the regular languages or the CFLs?
